#### **Outline**

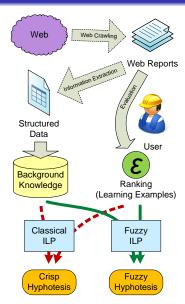

- Introduction
  - Our Information Extraction System
  - Description of the extraction method
  - Fuzzy ILP
- Our Experiment
  - Experiment Description
- Fuzzy ILP / GAP Implementation
  - Monotonization
- Evaluation and Conclusion
  - Learning Results
  - Evaluation
  - Conclusion

Our Information Extraction System

#### **Our work**

- Extraction of semantic information form texts.
  - In Czech language.
  - Coming form web pages.
- Using of Semantic Web ontologies.
  - RDF, OWL
- Exploiting of linguistic tools.
  - Mainly from the Prague Dependency Treebank project.
  - Experiments with the Czech WordNet.
- Rule based extraction method.
  - Extraction rules ≈ tree queries
  - ILP learning of extraction rules
- Fuzzy report classification
  - Application of Fuzzy ILP
  - Accident seriousness classification
  - Exploitation of extracted information

# Schema of the whole system

- Web Crawling
- Information Extraction and User Evaluation
- Logic representation
  - Construction of background knowledge
  - Construction of learning examples
- ILP Learning
  - Crisp
  - Fuzzy
- Comparison of results

Introduction

Our Information Extraction System

#### Example of processed web page

■HZS Jihomoravského kraje

Zubatého 1, 614 00 Brno, telefon 950 630 111. http://www.firebmo.cz.7

15 05 2007

V trahantu zemřeli dva lidé

Zpravodajství v roce 2006

K tragické nehodě dnes odpoledne hasiči vyjížděli na silnici z obce Česká do Kuřimi na Brněnsku.

Nehoda byla operačnímu středisku HZS ohlášena ve 13.13 hodin na místě zasahovala jednotka profesionálních hasičů ze stanice v Tišnově. Jednalo se o čelní srážku autobusu Karosa s vozidlem Trabant 601. Podle dostupných informací trabant jedoucí ve z Brna do Kuřimi zřejmě vyjel do protisměru, kde narazil do linkového autobusu dopravní společnosti ze Žďáru nad Sázavou. Ve zdemolovaném trabantu na místě zemřeli dva muži – 82letý senior a další muž, jehož totožnost

Hasiči udělali na vozidle protipožární opatření a po vyšetření a zadokumentování nehody dopravní policií vrak trabantu zaklesnutý pod autobusem pomocí lana odtrhli. Po odstranění střechy trabantu pak z kabiny vyprostili těla obou mužů. Obě vozidla – trabant i autobus, pak postupně odstranili na kraj vozovky a uvolnili tak jeden jízdní pruh. Únik provozních kapalin nebyl zijštěn. Po 16. hodině pomohli vrak trabantu naložit k odtahu a asistovali při odtažení autobusu. Po úklidu vozovky átce před 16 30 hod, místo nehody předali policistům a ukončili zásah

Fire and car accidents reports Introduction

# **Example of processed text**

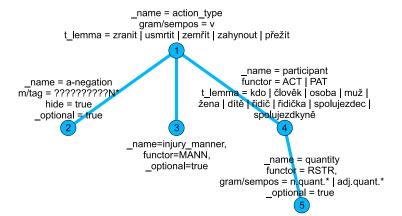

- Information to be extracted is decorated.
- See the last sentence on the next slide.

### **Example of a linguistic tree**

- ..., škodu vyšetřovatel předběžně vyčíslil na osm tisíc korun.
- ..., investigating officer preliminarily reckoned the damage to be 8 000 CZK.
- Our IE method uses tree queries (tree patterns)

#### Extraction rules – Netgraph queries

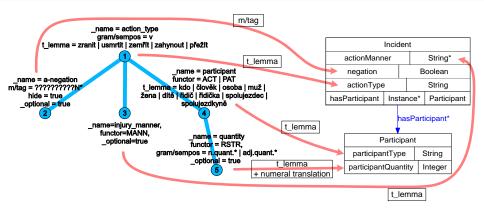

- Tree patterns on shape and nodes (on node attributes).
- Adopted form Netgraph application.
- Present and future fork: ILP learning of such queries.

Introduction

0000000000

#### Semantic interpretation of extraction rules

- Determines how particular values of attributes are used.
- Gives semantics to extraction rule.
- Gives semantics to extracted data.

Description of the extraction method

#### **Accident attributes**

attribute name	distinct values	missing values	monotonic
size (of file)	49	0	yes
type (of accident)	3	0	no
damage	18	30	yes
dur_minutes	30	17	yes
fatalities	4	0	yes
injuries	5	0	yes
cars	5	0	yes
amateur_units	7	1	yes
profesional_units	6	1	yes
pipes	7	8	yes
lather	3	2	yes
aqualung	3	3	yes
fan	3	2	yes
ranking	14	0	yes

- Information that we can/could extract from a report.
- Not everything is always mentioned.

# Classical ILP and Fuzzy ILP principles

- Learning examples  $E = P \cup N$  (Positive and Negative)
- Background knowledge B
- ILP task to find hypothesis H such that:

$$(\forall e \in P)(B \cup H \models e) \& (\forall n \in N)(B \cup H \not\models n).$$

- Fuzzy learning examples  $\mathcal{E}: E \longrightarrow [0,1]$
- Fuzzy background knowledge  $\mathcal{B}: B \longrightarrow [0, 1]$
- Fuzzy ILP task to find hyp.  $\mathcal{H}: H \longrightarrow [0,1]$  such that:

$$(\forall e_1, e_2 \in E)(\forall \mathcal{M})(\mathcal{M} \models_f \mathcal{B} \cup \mathcal{H}) \,:\, \mathcal{E}(e_1) > \mathcal{E}(e_2) \Rightarrow \|e_1\|_{\mathcal{M}} \geq \|e_2\|_{\mathcal{M}}$$

# **Generalized Annotated Programs**

- Fuzzy ILP is equivalent to Induction of Generalized Annotated Programs<sup>1</sup>
- For implementation we use GAP or strictly speaking:
   Definite Logic Programs with monotonicity axioms (also equivalent)
- Basic paradigm: deal with values as with degrees.
  - We don't have to normalize values, they order is enough.
- For example with monotonicity axioms we can use rule: serious(A, 4) ← fatalities(A, 10). and form the fact fatalities(id\_123, 1000) deduce serious alt(id 123, 4).

<sup>&</sup>lt;sup>1</sup>See in S. Krajci, R. Lencses and P. Vojtas: "A comparison of fuzzy and annotated logic programming", Fuzzy Sets and Systems, vol.144, 2004.

**Experiment Description** 

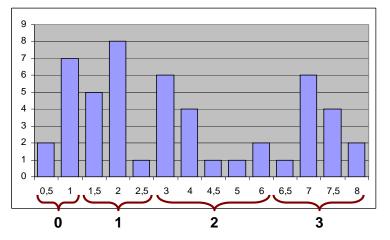

#### **Accident attributes**

	distinct	missing	
attribute name	values	values	monotonic
size (of file)	49	0	yes
type (of accident)	3	0	no
damage	18	30	yes
dur_minutes	30	17	yes
fatalities	4	0	yes
injuries	5	0	yes
cars	5	0	yes
amateur_units	7	1	yes
profesional_units	6	1	yes
pipes	7	8	yes
lather	3	2	yes
aqualung	3	3	yes
fan	3	2	yes
ranking	14	0	yes

- Almost all attributes are numeric.
  - So monotonic
  - This will be used for "fuzzyfication"
- Artificial target attribute seriousness ranking.

**Experiment Description** 

# Histogram of the seriousness ranking attribute

- 14 different values, range 0.5 − 8
- Divided into four approximately equipotent groups.

Monotonization

### Essential difference between learning examples

# **Crisp learning examples**

```
serious_2(id_47443). %positive
serious_0(id_47443). %negative
serious_1(id_47443). %negative
serious 3(id_47443). %negative
```

#### Monotonized learning examples

```
serious_atl_0(id_47443). *positive serious_atl_1(id_47443). *positive serious_atl_2(id_47443). *positive serious_atl_3(id_47443). *negative
```

For one evidence (occurrence):

- Crisp:
   Always one positive and three negative learning examples
- Monotonized:
   Up to the observed degree positive, the rest negative.

Monotonization

#### **Monotonization of attributes**

### damage\_atl ← damage

- We infer all lower values as sufficient.
- Treatment of unknown values.
- Negation as failure.

```
serious_0(A):-type(A,fire),pipes(A,0).
serious_0(A):-fatalities(A,0),pipes(A,1),lather(A,0).
serious_1(A):-amateur_units(A,1).
serious_1(A):-amateur_units(A,0),pipes(A,2),aqualung(A,1).
serious_1(A):-damage(A,300000).
serious_1(A):-damage(A,unknown),type(A,fire),prof_units(A,1).
```

serious\_1(A):-dur\_minutes(A,unknown), fatalities(A,0), cars(A,1). serious\_2(A):-lather(A,unknown). serious\_2(A):-lather(A,0), aqualung(A,1), fan(A,0). serious\_2(A):-amateur\_units(A,2),prof\_units(A,2). serious\_2(A):-dur\_minutes(A,unknown).injuries(A,2).

serious\_3(A):-fatalities(A,1). serious\_3(A):-fatalities(A,2).

serious\_3(A):-injuries(A,2), cars(A,2). serious\_3(A):-pipes(A,4).

serious O(A):-dur minutes(A,8).

serious\_atl\_0(A). serious\_atl\_1(A):-injuries\_atl(A,1). serious\_atl\_1(A):-lather\_atl(A,1).

serious\_atl\_1(A):-pipes\_atl(A,3). serious\_atl\_1(A):-dur\_minutes\_atl(A,unknown).

serious\_atl\_1(A):-size\_atl(A,764),pipes\_atl(A,1). serious\_atl\_1(A):-damage\_atl(A,8000),amateur\_units\_atl(A,3).

serious\_atl\_1(A):-type(A,car\_accident).
serious\_atl\_1(A):-pipes\_atl(A,unknown), randomized\_order\_atl(A,35).
serious\_atl\_2(A):-pipes\_atl(A,3), aqualung\_atl(A,1).
serious\_atl\_2(A):-type(A,car\_accident), cars\_atl(A,2),prof\_units\_atl(A,2).

serious\_atl\_2(A):-injuries\_atl(A,1),prof\_units\_atl(A,3),fan\_atl(A,0). serious\_atl\_2(A):-lype(A,other), aqualung\_atl(A,1). serious\_atl\_2(A):-dur\_minutes\_atl(A,59), pipes\_atl(A,3).

serious\_atl\_2(A):-dur\_minutes\_atl(A,59), pipes\_atl(A,3 serious\_atl\_2(A):-injuries\_atl(A,2), cars\_atl(A,2). serious\_atl\_2(A):-fatalities\_atl(A,1).

serious\_atl\_3(A):-fatalities\_atl(A,1). serious\_atl\_3(A):-dur\_minutes\_atl(A,unknown),pipes\_atl(A,3). Crisp hypothesis

- Monotonized hypothesis
  - Monotonicity axioms
  - Monotonized learning examples

Evaluation

# **Evaluation and Comparison of Results**

		Raw ILP	Monot. ILP
Monot. test set	TP:	42	57
positive: 64	FP:	7	6
negative: 36	Precision:	0,857	0,905
sum: 100	Recall:	0,656	0,891
	F-measure:	0,743	0,898
Crisp test set	TP:	12	15
positive: 25	FP:	13	10
negative: 75	Precision:	0,480	0,600
sum: 100	Recall:	0,480	0,600
	F-measure:	0,480	0,600

- Rules evaluated on both testing sets.
  - By use of conversion predicates (next slide)
- Monotonized rules better in both cases.

Evaluation

#### **Conversion of Results**

# crisp ← monotone

# monotone ← crisp

```
serious_atl_0(ID) :- serious_2(ID).
serious_atl_1(ID) :- serious_2(ID).
serious atl 2(ID) :- serious 2(ID).
```

Conclusion

#### Conclusion

- We used Fuzzy/GAP ILP in an experiment closely connect with WIE.
- Showed basic principles and implementation of Fuzzy/GAP ILP.
- Compared results of Fuzzy/GAP ILP and Classical ILP.
- Observed much better results in the Fuzzy case.
- Future work:
  - Improvement of the extraction method
  - Other languages, other domains
  - Finer "approximatization" of target attribute (not only "four degrees").
- Title of my thesis: Semantic Annotations
